People facing severe acute food insecurity (IPC Phase 3+) IN NEED OF URGENT ACTION

Phase 5	o People in Catastrophe
Phase 4	2 695 000 People in Emergency
Phase 3	8 602 000 People in Crisis
Phase 2	8 450 000 People in Stress
Phase 1	9 978 000 People minimally food insecure

Overview

Between August and October 2019, it is estimated that total 10.23 million people (33% of the total population) are in severe acute food insecurity and require urgent humanitarian action. These include around 7.79 million people in a crisis situation (IPC Phase 3) and 2.43 million people in an emergency situation (IPC Phase 4). Around 10.37 million people are also in a stressed situation (IPC Phase 2) and require livelihood support.

Between November 2019 and March 2020, around 11.30 million people (37% of the total population) are estimated to be likely to experience severe acute food insecurity, out of which an estimated 8.6 million people likely be in an emergency situation (IPC Phase 4). Furthermore around 9.45 million people will be in a stressed situation (IPC Phase 2).

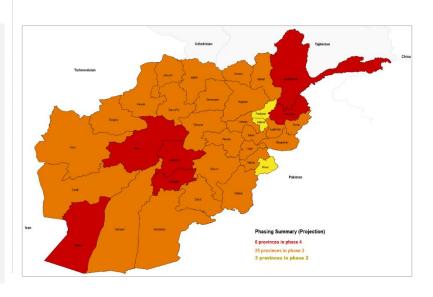

Key Drivers

High Unemployment: High unemployment rates have led to reduce household income, low purchasing power and reduced food access. Conflict: Ongoing conflict in most of the provinces, has led to displacement, caused loss of livelihood or affected people's livelihoods, and as a result farmers don't have access to their agricultural lands for cultivation and harvesting at the right time and similarly affected livestock and other sector.

High Food Prices: Unusually high food prices of commodities further exacerbate food access for the households already living below the poverty line.

Natural Disaster: Floods have resulted in the loss of shelters and productive assets causing displacement and increasing food insecurity

Drought: The lingering impacts of last year's severe drought which significantly affected agriculture and livestock sectors in most of the provinces, have led to a decrease in agriculture and livestock productivity.

SITUATION OVERVIEW AND KEY DRIVERS

Current Situation Overview

As of September 2019, 10.23 million people (33% of the population) are estimated to be in Food Crisis and Emergency (IPC Phase 3 and Phase 4). An estimated 2.44 million are classified in IPC Phase 4 nationwide: these people require urgent action to reduce food consumption gaps and to protect/save livelihoods and reduce acute malnutrition. The current Phase 3 and 4 estimates correspond to a 10.6 percentage points decrease (from 43.6% to 33%) compared to the previous analysis for the same period last year (2018). It should be noted that the 2018 analysis only took into account rural population of the country, whereas the 2019 analysis includes both (rural and urban) population of Afghanistan, where urban population are the same or even mostly higher food insecure than rural population. Out of all 34 provinces, 2 provinces (Uruzgan and Nuristan) are classified in IPC Phase 4. No province is classified in IPC Phase 1 and 11 provinces namely Parwan, Khost, Kapisa, Jawzjan, Hilmand, Ghazni, Paktika, Logar, Panjsher, Baghlan and Kunduz are classified in IPC Phase 2. The remaining 21 provinces are classified in IPC Phase 3: Kabul, Badghis, Badakhshan, Takhar, Kunar, Laghman, Nangarhar, Faryab, Balkh, Samangan, Sar-i-Pul, Daykundi, Bamyan, Wardak, Paktia, Kabdahar, Zabul, Nimroz, Ghor, Farah and Herat. Additionally, no provinces are classified in Phase 5. The results of the IPC analysis show that the food security situation has to some extent improved compared to last year, although it is still very severe, while the number of food insecure increased due inclusion of urbans in IPC analysis this year.

Provinces of Badghis, Ghor, Badakshan, Daykundi, Nimroz, Nuristan and Uruzgan have the highest percentage of population in phase 3 and 4, respectively, where more than half of population are in these phases. Provinces of Kabul, Hirat, Nangarhar, Balk and Badakshan have the highest number of populations in phase 3 and 4, respectively. Afghanistan experienced a major livelihood crisis in 2018, primarily caused by the severe drought, which lowered food production and depleted farmers' and livestock keepers' assets and livelihoods. Favourable precipitation during the last winter season, coupled with the mitigating effects of Humanitarian Food Assistance contributed to food security especially for the provinces that were classified in higher phases last year, e.g. Badghis. However, the results of the IPC analysis reveal that a large proportion of the population is still food insecure due to prominent impacts of last year's drought, shocks experienced by 60 percent of population mainly loss of employment, reduced income, death of household breadwinner, conflict, flood and high food price, particularly those households that had to resort to emergency coping mechanisms. Due to mentioned reasons, despite of increased agriculture production had not significant impact on food security improvement.

The results of the 2019 Seasonal Food Security Assessment (SFSA) show that around six households out of ten reported that they have experienced some shocks. Provinces of Wardak, Nuristan, Bamyan, Farah, Helmand, Faryab and Ghor faced highest level of shocks, respectively, where more than 80 percent of household are affected. Loss of employment (29%), reduced income (25%) and severe sickness or death of breadwinner (12%) are the major first shocks that households experienced. Nearly half (47%) of the households reported that their income has decreased compared to last year, of which around 60% reported reduced employment opportunities as the main reason for their income reduction followed by conflict (25%). Floods and other types of natural disasters are also key driving factors in terms of displacing the communities. UNOCHA has reported 282,823 individuals as conflict-induced IDPs in 2019. Takhar, Nangarhar, Kunar, Faryab, Kunduz and Balkh provinces have the highest report of conflict -related insecurity. As per UNHCR and IOM, an estimated 4,700 documented and 305,000 undocumented people returned to Afghanistan from Pakistan and Iran in 2019, many of whom may face food insecurity as they likely have difficulties in engaging in normal livelihoods.

Only one in four households are depending on salary (11.8%), skilled labour (10%) and remittances (2%) as first sources of income, regarded as sustainable sources of income while remaining are depending on agriculture, orchard products, livestock sales, non-agricultural wage labour, petty trade, charity/begging etc. and are vulnerable to any kinds of shocks/disasters. If the country would need to import more high-priced food, the food insecurity could further spread into higher socio-economic classes as well. Moreover, increased civil conflict and instability as well as the severely degraded condition of much of the land have compounded the impacts of situation, leading to the ongoing food security crisis.

Agriculture as one of the main livelihood sources for people of the country, where around half of households have access to is mostly subsistent, where in good year like the current, own production for half of the households, lasts only for less than six months and they need to cover the rest from other sources like purchase from saving, sell assets and livestock, borrow food work for food and cash and send household members out of the country to send money to buy food. Crops pest and diseases, damaged irrigation system, problem

IPC ACUTE FOOD INSECURITY ANALYSIS

AUGUST 2019 – MARCH 2020

Issued in September 2019

and access to seed and fertilizer are among major agriculture problems that farmers faced to. Seventh four percent of those with access to agriculture land reported they will not have access to wheat seed from own production and more than half of hem have no means to get the required amount of seed for next year cultivation.

Livestock is livelihood sources is owned by 49 percent of households. Drought 2018 not only affected agriculture, but more than that affected livestock due to distress in drought affected provinces. Good precipitation and favourable pasture condition this year, allows livestock owners for restocking as there was 15 percent decrease in average number of sheep's and goats compared to last year. Provinces of Bakh, Jawzja, Nimroz and Badghis faced highest average decrease in number of sheep and goats. Twenty Eight percent of households reported increase livestock productivity this year. Access to veterinary services, water, market, pasture, money are challenges this sector of livelihood is faced to even in a good year. Overall 67 percent of population reported debt, which is mainly used to buy food and pay for health costs.

Projected Situation Overview

During the projection analysis period, from November 2019 to March 2020, the total population in IPC Phase 3 and IPC Phase 4 is expected to increase to 11.31million (37% of the population). However, the number of Phase 4 provinces is expected to increase to 6 from 2, adding Ghor, Nimroz, Badakhshan, and Daykundi. Out of 11 provinces classified in phase 2 in the current analysis Only 3 provinces (Panjshir, Khost and Kapisa) will remain in IPC Phase 2 while remaining provinces will be classified in Phase 3 in the projection period.

Based on FEWS NET precipitation forecasts, in the projection period, near average **rainfall** conditions are expected country-wide between November 2019 and March 2020, starting in late October or November. This will likely have different impacts depending on the areas. Those that typically receive less than adequate rainfall will continue to face a deteriorating situation characterized by late planting and limited casual labour opportunities resulting in limited agricultural labour wages and low purchasing power. However, for most of the provinces, the rainfall is not expected to have any immediate impact on the food security elements, as there is no production during in most part of the country during the projection period, except few provinces with second harvest coming in October and November.

Inaccessibility to food markets and road blockages in some areas of the country like central highland, Ghor, some districts of Badakshan and few districts in north of the country will limit the access of people to food due to heavy snowfall in the winter season. On the other hand, above average temperature will decrease the density of snowpack and result in river/flash floods, which may ultimately have a negative impact on snow pack and snow depth required during the rest of the agriculture season. Flash floods will threaten soil fertility, pastures and fields and could potentially prevent successful planting.

Lack of **employment opportunities** during the winter season can affect the vulnerable food insecure people who mainly rely on wage labour for their main livelihood. The **price** of wheat during the entire projection period will likely to be above current time looking at price trend and seasonality pattern, with high and increasing levels due to low supply and high demand. Afghanistan is dependent on importation of wheat flour from neighbouring countries, especially Kazakhstan.

The area planted with 2019 winter wheat in Kazakhstan is estimated to be below the average level, reflecting the Government directive to progressively reduce all wheat (spring and winter) planted in favour of more profitable oil crops, and this could potentially increase the prices. Prices of staple food items are also expected to increase during the projection period, particularly for the hard to reach areas. Food prices over the projected period are likely to be the key factor that determines extent of household access to food and food consumption in the coming months. Around 3% households said their cereal stocks from own production last less than a month, for 12% it lasts between 1 to 3 months while for 30% it lasts between 3 to 6 months. Around 55% of households reported their food stock lasts for 6 months or more. **Conflicts** are expected to decrease during the projected period (as the weather gets cold), but considering the upcoming presidential election there is a likelihood of continuing insecurity which would further restrict household food access. In addition, the inflow of **returnees** to their place of origin is expected to continue in the projection period, and these vulnerable groups may be in need of humanitarian food assistance.

RECOMMENDATIONS FOR ACTION

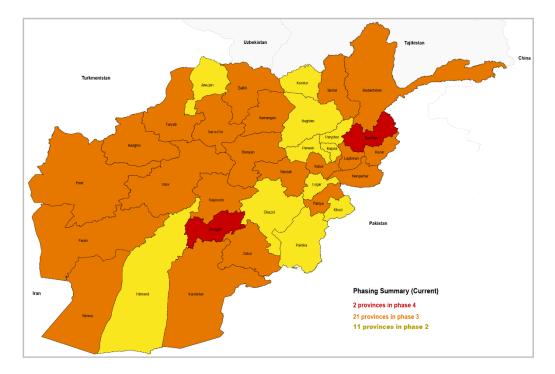

Response Priorities

In order to address the country food insecurity, following interventions are recommended for the most affected areas:

- Urgent action is required to save lives, protect livelihood, and reduce food consumption gaps of populations classified in IPC Phase 4 (Emergency) and IPC Phase 3 (Crisis).
- Humanitarian Food Assistance in kind or cash should be provided to the households facing severe acute food insecurity. Food for Asset activities should be further promoted.
- Majority of the farmers do not have enough seeds of their own wheat for next season and most of the farmers are not able to obtain seeds from any sources in sufficient quantity or will not find them at all. It is highly recommended to assist the farmers in terms of agriculture-based livelihood response.
- The complex context of Afghanistan including ethnically diverse people, rugged terrain and unrelenting civil unrest needs to be taken into account when developing strategies for food and livelihood security programming.
- Considering the regular occurrence of environmental shocks, stakeholders should also focus their attention and funding on programs to build resilience to disasters and reduce disaster risks.
- Improving and strengthening water irrigation systems through livelihoods programmes.

Situation Monitoring and Update of Activities

- Performance of the labour market, including any declines in employment opportunities that would potentially impact the livelihood strategies of vulnerable groups.
- Changes in food prices especially the price of wheat, rice, maize and pulses need to be monitored, especially in the winter months which is the peak of the lean season when prices are expected to increase slightly.
- Abnormal rainfall patterns would increase the probability of natural hazards such as droughts and floods.
- Deterioration of security situation in provinces may trigger the displacement of rural population to cities.
- Uncertainty of political context and upcoming election may strongly impact the security situation which will ultimately negatively impact the food security situation.
- The El Niño conditions need to be closely monitored. Both excessive and insufficient rainfalls could have negative implications on the upcoming planting and/or harvesting seasons and additional food and livelihood emergency response may be needed.

Overview of map (MAP KEY) IPC Acute Food Insecurity Phase Classification

Mapped phase represents highest severity affecting at least 33% of the population As of September 2019, 10.23 million people (33% of the population) were estimated to be in Food Crisis and Emergency (IPC Phase 3 and Phase 4). An estimated 2.4 million are classified in IPC Phase 4 nationwide.

									,					
Zabul	3	377,648	113,294	30	113,294	30	113,294	30	37,765	10			151,059	40
Grand Total		30,725,560	10,118,714	33	10,374,605	34	7,793,849	25	2,438,392	8	0	0	10,232,241	33

Note: A population in Phase 3+ does not necessarily reflect the full population in need of urgent action. This is because some households may be in Phase 2 or even in Phase 1 but only because of receipt of assistance, and as a result, they may be in need of continued action. This IPC classification met the highest evidence level (***High) for all analysis areas.

PROJECTED IPC ACUTE FOOD INSECURITY SITUATION FOR (November 2019 – March 2020)

Overview of map (MAP KEY) - Projected **IPC Acute Food Insecurity Phase Classification**

In the projection period, from November 2019 to March 2020, the total population in IPC Phase 3 and IPC Phase 4 is expected to increase to 11.30 million (37% of the population). The number of Phase 4 provinces is expected to increase to 6, adding Ghor, Nimroz, Badakhshan, and Daykundi to Uruzgan and Nuristan. Out of 11 provinces in IPC Phase 2 in current analysis, only 3 provinces (Panjshir, Khost, and Kapisa) will remain in IPC Phase 2 and the remaining provinces will be classified in Phase 3.

Zabul	3	377,648	75,530	20	169,942	45	113,294	30	18,882	5			132,177	35
Grand Total		30,725,560	9,978,015	32	9,450,138	31	8,602,449	28	2,694,957	9			11,297,40	37

Note: A population in Phase 3+ does not necessarily reflect the full population in need of urgent action. This is because some households may be in Phase 2 or even in phase 1 but only because of receipt of assistance, and as a result, they may be in need of continued action. This IPC classification met the highest evidence level (***High) for all analysis areas.

PROCESS, METHODOLOGY AND LIMITATIONS

Process and Methodology

This year (2019) IPC analysis assessed two time periods: the current analysis (August to October 2019) was based on surveys and data collected from 2017-2019 that reflected existing factors that lead to food insecurity; and the projected analysis (November 2019 to March 2020). The analysis covered all 34 provinces of the country, and data were compiled and assessed at the provincial level. A national analysis workshop preceded by a 4 days training was held on 12 - 19 September 2019 in Kabul and was attended by national technical experts as well as over 50 professionals from across Afghanistan, representing provincial and central governments, UN organizations, NGOs, technical agencies, and academia. This year international technical experts could not attend due to security restrictions related to Presidential elections due on 28 September 2019, but they were committed to providing remote technical support to national technical experts. A remote support team was formed within the IPC Global Support Unit (IPC GSU) that was on stand-by to support analysis co-leads throughout the training and analysis workshops. The data used in the analysis were organized according to the IPC analytical framework, which includes predefined food security contributing factors and outcome indicators. There were collected from a wide range of sources; including reports from the Ministry of Agriculture, Irrigation and Livestock, other government institutions at national and provincial levels, and international organizations.

Limitations of the analysis

Comparatively speaking this year's analysis did not have major limitations. As recommended last year, a full version of the IPC Manual 3.0 training was conducted before the analysis workshop and the number of days for the analysis were increased to 7 which were enough for the analysts to do thorough analysis and present each area phase classification with concrete evidence, followed by questions and answers sessions and finally reaching to a technical consensus except one partner (FEWSNET) who respectfully disagrees with the Phase

What is the IPC and IPC Acute Food Insecurity?

classification of 12 provinces on the current and 16 provinces on the projection period. A minor limitation of the analysis was also the presence of new staff of a few relevant agencies; if this trend continues for next years, a full version of the IPC Manual 3.0 training is needed prior to the start of the analysis workshop.

Sources

Data sources used for the analysis included: 1) The Seasonal Food Security Assessment (SFSA) 2019 conducted by Food Security and Agriculture Cluster (FSAC) as the main data set, which was carried out for rural and urban areas of the country with a sample size of around 21000 households. 2) The Agriculture Production and Food Price data from MAIL; 3) the SMART Surveys 2018 and 2019 from ACF; 4) Population Estimation from the National Statistics Information Authority (NSIA) of Afghanistan; 5) the ALCS, 2016-2017 from NSIA; 6) Food Prices and Food Distribution reports from WFP; 7) NDVI, Precipitation from FEWSNET; 8) Refugee & IDP data from UNHCR, OCHA, FSAC, IOM; 9) Natural disaster affected population data from IOM and FSAC; 10) the 2016 Land Cover Atlas from FAO; 11) the Whole of Afghanistan Assessment from REACH International; 12) the Jan-July 2019 FSAC Response Plan; and 13) data on humanitarian assistance delivered and planned from WFP and localized assessment conducted by I/NNGOs.

Note: It is worth mentioning that the population estimates currently used in IPC acute analysis are the NSIA official estimates for Afghanistan (2019-2020). In case the flow minder new population estimates for Afghanistan are applied in IPC population estimates, 3 million people would be in IPC phase-4 and 9.53 million in IPC phase-3 for current classification. For projection period, the number would be 3.6 million and 10.5 million, respectively, in phases 4 and 3. (Population Table is attached as Annex)
